The Chairman of the Committee for
Architecture and Construction under the
Government of the Republic of
Tajikistan

_____ J. Ahmadzoda

National Report
on the development of human settlements of the Republic of Tajikistan
for the UN World Conference on Human Settlements HABITAT III

Dushanbe, 2016

Introduction

19 years have passed since the Second United Nations Conference on Human Settlements HABITAT II that was held on 3-14 June 1996 in Istanbul, Turkey, and which concluded with the adoption of the Istanbul Declaration on Human Settlements and the "Habitat Agenda" by the heads of states and governments of the world powers. The Declaration contains fundamental documents, including purposes and principles, commitments and global action plan aimed at achieving the dual goal of UN-Habitat, which was to ensure safety, viability, productivity, sustainable development of human settlements and providing adequate shelter for all people in the world.

The implementation of the Habitat Agenda over the past 19 years underlines the need to analyze the accumulated experience and goals achieved through a set of policies and strategies, as well as the failures that had to be abided. Approaches have changed: first, instead of fragmented and sector-by-sector implementation of the Agenda, an integrated approach was introduced, that resulted in the improvement of linkages in the condition of dynamic development of settlements. Secondly, by replacing the policy of deregulation of housing market, progressive approaches were adopted by a number of governments and non-state actors in order to strengthen commitments of the Agenda aimed at ensuring full realization of the right for adequate housing. Thirdly, more emphasis is now placed on the sustainable development of human settlements.

The next third UN conference on housing and sustainable urban development HABITAT III, which will be held in 2016, will serve as a forum for serious consultations between the governments regarding the future of cities in the world - the future, which is characterized by unprecedented challenges and serious risks.

In order to support global commitment of the countries to sustainable development and to assess the implementation of the Habitat Agenda by the countries, the UN World Conference on Human Settlements is held every 20 years. Within the preparation for the conference, a National Report on housing and sustainable development of human settlements in the Republic of Tajikistan was prepared.

The report identifies the problems associated with the development of human settlements, trends and prospects, and the experience of how to overcome difficulties of development.

Purpose of CIS National Reports

National Reports include a number of objectives as below:

1. Prepare comprehensive analytical review of the condition of the country's settlements and the assessment of the implementation of the Habitat Agenda and the Declaration on Cities and Other Human Settlements in the New Millennium, adopted in 1996 in Istanbul.
2. Identification of the main obstacles to the realization of the objectives set out in the above documents.
3. Review of new challenges and opportunities arisen since the Conference (Habitat II).
4. Development of proposals in the field of human settlements development, which shall contribute to overcoming new challenges and raising the role of human settlements and relevant institutional mechanisms on sustainable urban development and residential construction.

Structure of National Report

The national reports covers six key topics, which address problems and challenges for the New Agenda on cities:

1. Demographic problems of human settlements
2. Land and urban planning
3. Environment and Urbanization
4. Management and Legislation
5. Urban Economy
6. Housing and basic services

Section 1. Demographic problems of human settlements

This section covers such issues as management of rapid urbanization, management of inter-relations between urban and rural areas, problems of the youth and elderly people, gender equality in urban development.

Subsection 1.1. Managing rapid urbanization

Urbanization in the world today is one of the main trends in the development of mankind. Today, 50% of the world's population live in cities, and in 40 years, more than 70% of the world's population will live and work in cities. Urbanization is neither more nor less than a natural consequence and stimulus of economic development at the stage of industrialization and post-industrialization.

Level of urbanization and the proportion of urban and rural population in the total population of the republic.

Modern urban planning practice focuses on more task-oriented area organization of regions and administrative districts for the purposes of development of production and social reproduction, sustainable land use and environmental protection. Urban planning takes into account socio-economic needs in the organization of production processes, labor and public life, utilities network, etc.

Consequently, the dynamic urban development requires special attention to the definition of structure of the activity, its boundaries and links with other fields of knowledge - social basis for the development of society. At the turn of the XXI century, an urban planner for the first time refers to a functional and planning organization of cities and rural settlements in modern understanding of this problem. In the 60s of the last century forming of urban planning - regional planning and planning of a higher level - spatial planning posed new challenges in respect of urban development at the state level - the planning of the regional and nationwide settlement. Unfortunately this important urban planning and design, which was the basis for managing territorial distribution and sustainable development of the network of urban settlements fell out from the urban policy of many CIS countries after the Soviet Union collapse. Consequently, in the Republic of Tajikistan as well, this program concept is not sufficiently developed in urban planning documents and there is no research works towards sustainable development of urban settlements.

It is characteristic that in this nation-wide strategic project architects-planners must take a leading part in the development of the general settlement arrangements and territorial organization of settlements on the territory of the country. Unfortunately at the moment this question has dropped out of the sight of modern republic of urban policy. Currently in the country there is no clearly defined urban development design and planning documentation for the development of a general settlement arrangements and territorial organization of settlements in the country.

In this context, geographical position of the city or rural settlement on the territory of the Republic of Tajikistan is of particular importance, since 93% of the territory occupied by mountains. And 7% of lowland areas have developed intensive agriculture, industry, where about 80% of the population occur.

This peculiarity defined the specificity of settlement in the territory of the republic. The general population (over 85%) is located on the territory of the valleys, foothills and lowland plains, at altitudes ranging from 600 m to 1500 m above sea level. The rest (15%) of the population occur on the remaining mountain areas.

With the independence of the Republic of Tajikistan big changes has taken place associated with characteristics of difficulties to manage changes throughout the country. All this combined at different stages had an impact both on the economy and social structure, and forming of the republic settlement system. This in turn has had a significant impact on the culture, lifestyle, architecture and urban planning.

In the context of climatic conditions, the Republic of Tajikistan is dominated by different climatic regimes - from soft climate on south-western territories, to severe cold in high-mountains, such as the Pamirs mountain system. In addition, the entire territory of Tajikistan is located in the zone of high seismic activity. Most cities and villages are located in the zones 7, 8 and 9-point seismicity as per the MSK-64 scale.

Administrative-territorial division of the Republic of Tajikistan

The Republic of Tajikistan is administratively divided into 4 regions:- Sughd, Khatlon, Gorno-Badakhshan Autonomous Region (GBAO) and Districts of Republican Subordination (RRP).

The territory of Sughd region is 25.2 thousand sq.km, Khatlon region - 24.7 thousand sq.km, GBAO - 64.1 thousand sq.km, and RRP - 28.5 thousand sq.km.

The administrative center of Sughd region is the city of Khujand, of Khatlon region - the city of Kurgan-Tube, of GBAO - Khorog, and the center of RRP is Dushanbe.

Population by region is different: Khatlon - 2898.6 thousand people; Sughd - 2400.6 thousand people; RRP - 1874.0 thousand people; GBAO - 212.1 thousand people.

Large ranges between absolutes height above sea level, the diversity of climatic conditions in different parts of the country have identified large unevenness in the distribution of populated areas network: - from dense networks of urban and rural settlements in the plains (valleys) and foothill areas, at altitudes of 300m to 800-1000m above sea level, to the fragmented network of rural settlements in the mountainous areas of the republic located at altitudes from 1500 to 2500m above sea level. These climatic and socio-economic conditions of the Republic specify the difference in population growth, the form of settlement and population density as well as further transformation of rural localities network.

- **The rate of urban population growth** - is expressed as a percentage relative value, which is calculated as an indicator of overall increase in urban population during the year due to natural increase and migration.

Cities and urban settlements:

The majority of the republic's residents lives in cities, settlements and rural areas located at an altitude of 1000m above sea level. More than 25% of rural population live at the zones between 1000 and 2000m, and only 5% of the rural population live at altitudes above 2000m in the mountain regions of the republic.

Currently, there are 17 large and medium cities in the country, 57 urban settlements and more than 3,900 villages. The distribution of population between urban and rural areas is uneven, the urban population is 27%, whereas the share of the rural population accounts for 73%. In Tajikistan, where the most of the country is covered by mountainous, urban development is slow, which means, that Tajikistan is poorly urbanized country.

Most of the towns are small towns and urban settlements – they are relatively small settlements with a population of 10-40 thousand people. The greatest number located in northern Tajikistan, Hissar, Vakhsh and other valleys of the republic. The lowest proportion of urban population is typical for mountain areas of Central Tajikistan (Districts of Republican Subordination) and Gorno-Badakhshan Autonomous Region (GBAO).

The growth of urban population was noted in the thirties as a result of overall industrial development of the country. With the general growth of the population in 1917-1985 by 4.4 times, the urban population has increased almost 15 times. And now, since 1990, urban population growth is relatively slow.

Among the highly urbanized cities, the first place in terms of number of residents of Tajikistan's population belongs Dushanbe - the capital of the Republic. Over the past 23 years its population has increased by 33% and in 2014 amounted to 724.8 thousand people. Another major center is the city of Khujand - the center of the Sughd region with a population of 162.8 thousand people, and also Kulyab, Gissar, Pendzhikent and Istaravshan..

Large cities are Khujand - 162.8 thousand people, Kulyab -. 95.0 thousand people and Kurgan-Tube - 75.6 thousand people. Among historic towns of Tajikistan an important place belongs to the city of Istaravshan – its 2500 anniversary was celebrated in 2002. This is a big town populated by 60.2 thousand people. The 2,700th anniversary of Kulyab was celebrated in 2005. Gissar, Pendzhikent and Istaravshan are another large cities of Tajikistan.

The Republic of Tajikistan belongs to mountain regions of Central Asia. At present, the total area of rural villages located in valleys and piedmont plains, is about 73 thous. hectares, and industrial enterprises, built-up area, transport and other economic organizations occupy more territory - about 235 thousand hectares, which are valuable farmlands.

Therefore, the land factor in the organization of development of rural localities and urban areas is of particular importance.

As a result of irrational and bad organization of planning and development of rural settlements and cities in the country, large areas of farmlands were built up and taken out from agricultural production.

Urban development problems.

In the Republic of Tajikistan governmental authorities are responsible for planning and financing of development and management of urban land use. General Directorate for Land Management of the Republic of Tajikistan has been and remains the only authority-owner of the land. State Urban Development management authority is the Committee for Architecture and Construction which is the only authority that establishes rules for the use and development of territories. As for individuals and individual entrepreneurs, they are only users and consumers of land and construction products.

In the Republic, after the collapse of the USSR and creation of new political and economic systems of town planning, the town-planning activities became weakly financed by the state; the master plans of cities and towns became outdated and no longer comply with the new social and economic conditions. Master plans of cities were developed and approved as early as in 1973-1985 years. New master plans of cities began to be developed only in 2005.

Building of individual houses are often carried out without designs and with no coordination with architectural services of local authorities, without coordination with the general plans of cities. Urban area lands, which are strictly regulated by the master plan, are often used for non-purpose. Building limits are often violated and lands are seized by the residents along with violation of the "red line" border. Along with that, urban area is limited to the boundaries of rural areas or difficult terrain areas and mountain slopes.

As it is stated in the Habitat Agenda in Section IVC «Sustainable human settlements development in urbanizing world" balanced development of human settlements in rural areas is the essential condition for integration of rural areas into the national economy of any country.

In terms of urban planning, sustainable development of cities and inter-settlement territories means providing favorable living environment, and, as related, limiting harmful effects on the environment in order to create favorable living conditions not only for the living but also for future generations.

DYNAMICS OF POPULATION SIZE IN URBAN AND RURAL AREAS OF THE REPUBLIC OF TAJIKISTAN

Years	Population size at the beginning of the year, thous.	including		Urban population (%)	Rate of population growth, %

Subsection 1.2. Managing relationships between town and countryside.

The subsection contains characteristic for controlling rural and urban populations in the country, as well as a detailed description of levels of management, carrying out the planning and design of sustainable cities.

- Internal migration of the population.

In Tajikistan, urban and rural areas are interdependent economically, socially and environmentally. Now in the country, more than 73% of the population live in rural settlements. In order to ensure more sustainable future of the republic these rural settlements should be cherished and need to be maintained.

Inadequate infrastructure and services, lack of plain lands and agricultural lands, resulting from the adverse effects of urbanization and unsustainable land use seriously aggravate the degradation of the environment in rural areas. Also, lack of rural employment opportunities leads to the expansion of migration from rural to urban areas, as well as to other countries that contributes to the depletion of human resources in rural communities.

The study of the formation conditions of republic settlement systems shows that in areas with developed networks of urban settlements (Hissar valley, Khatlon and Sughd) communications are being developed of rural settlements with cities through the inclusion of a significant part of the (adjacent to the city) rural population into urban production and trade without changing living place. This evidences that intensive pendulum migration of the rural population to the cities is

the inevitable companion of forming a network of rural settlements around urban settlements.

Migration is the movement of people (migrants) across borders of one or another territory along with changing the place of residence. Data on migration is being gathered as the result of information coming from the internal affairs bodies, statistical record coupons of arrivals and departures, which are prepared together with the address forms during registration and deregistration.

Migration increase (outflow) of the population (net migration) is the difference between the number of arrivals on any territory and the number of departures from this territory. Exceeding the number of arrivals over the number of those, who left, shows the migration growth with a plus sign. Exceeding the number of those, who left over arrivals shows the migration outflow with a minus sign.

GENERAL RESULTS OF MIGRATION IN THE REPUBLIC OF TAJIKISTAN

Years	Foreign migration			Domestic migration			Total migration

2014									

For the implementation of policies and programs for sustainable rural development, which should ensure integration of rural areas into the national economy, it is required to initiate highly efficient research and development works on human settlements planning and management of their buildings, which would pay particular attention to the links between urban and rural areas, as well as would consider the town and village as the two ends of a human settlements evolution.

In Tajikistan, rural people, including the mountainous population, play an important role in ensuring food security and maintaining social and ecological balance on big mountainous areas.

Rural administrative district is a socio-economic complex, which includes businesses and organizations of agroindustrial complex (APK), and other sectors of the economy and social sphere (schools, nurseries, health care facilities, libraries and clubs, shopping rows, etc.). These facilities need constant development and strengthening of material and technical base, for which local executive authorities - Hukumats should have sufficient resources and rights to reconstruct them and improve their architectural appearance in line with the demand of time.

In connection with the worsening economic crisis and social and political situation, in the conditions of Tajikistan it is noted a particular need for a comprehensive study of the capacities of mountain region in order further to reasonable use it to raise the economy of the Republic. The problem of exploration and development of mountain areas has always been in the foreground. Now it is aggravated due the fact that for a large part of the rural population, the living in mountains is traditional and accompanied by centuries-old traditions, which are associated with the lifestyle and farming methods. Along with this, the mountain area has great potential for development of productive forces and settlement planning.

Subsection 1.3. Meeting needs of the youth

Learning the real needs of young people is a key element in the social infrastructure in a particular locality. There is no doubt that the degree of satisfaction of young people in education, employment, various kinds of service, leisure needs depends on further development of villages, the level of migration, etc.

Subsection 1.4. Meeting the needs people of different age groups.

This subsection reflects the orientation of the policy pursued by local authorities towards requests of different age groups and their needs, and the availability of social and cultural infrastructure.

- **Age and sex structure of the population** – is the ratio of gender and age groups of the population, which are characterized by the distribution of the country's population into two categories: sex and age composition.

**NUMBER OF RESIDENT POPULATION BY SEX, AGE, URBAN AND RURAL AREAS OF
THE REPUBLIC OF TAJIKISTAN**
(at the beginning of the year, people)

- ***Ratio of coverage by preschool education of the population aged 1-6 years old*** - the ratio of the number of children attending preschool establishments to the total number of children aged 1-6 years, minus the children of 5-6 years old attending school (on a percentage base).

Preschool educational establishments - the type of educational establishments

implementing educational programs of various kinds of preschool education, providing education, training, care, rehabilitation of children from 1 year to 6 (7) years old.

Coverage of children by preschool establishments is determined by the ratio of the number of children attending preschool establishments to the number of children aged 1-6 years, according to statistics of demography, adjusted for the number of children of 6 years old enrolled in schools.

Availability of places for children in preschool establishments (100 places are for children) is expressed by the ratio of places in preschool establishments.

- Ratio of the population covered by basic education (regular schools) - the ratio of the number of learners in basic education programs to the population aged 10-14

years (percentage).

Learners in daytime basic education establishments - are persons enrolled in primary, basic, secondary (complete) schools, gymnasiums, lyceums, as well as pupils in schools for children with mental and physical disabilities.

Total number of students of higher and secondary professional education include foreign citizens who study in the country.

- Number of catering for 1000 people, including baby food

This subsection should reflect the orientation of the policy pursued by local authorities towards the requests of different age groups, their needs, the availability of social and cultural infrastructure. Because depending on the age the population needs are transformed, it is important to make the report focus on the satisfaction of several age groups - children, youth, middle-aged people, elderly. For example, the youth is characterized by increased interest in the field of entertainment and education, fast food restaurants, libraries.

For this section it is necessary to devote special researches and sociological surveys of urban residents of different age groups regarding the availability of social and cultural infrastructure. It is a topic for a separate research that needs to be financed. Therefore, at the present stage of implementing the program of sustainable development of urban settlements and a network of rural localities in conditions of mountainous countries there is a need to establish the Centre for Integrated Development of Mountain Region in the condition of urbanizing world.

Therefore we propose to establish such center in the Republic of Tajikistan, since at the Tajik Technical University, we have carried out certain works on the concept of improving the network of rural settlements and sustainable development of small towns with the account of developing agriculture complexes and mountain-recreation systems for integrated development of mountain regions.

Subsection 1.5. Ensuring gender equality in urban development.

This subsection describes the gender situation in the country and main aspects of the ongoing gender policy, which should be aimed at ensuring equal rights and opportunities of women and men in education and training, in work and career development, in social, political, cultural, etc. areas, as well as at providing conditions for safety and health management. Here there are also described main problems, ways forward and achievements over the twenty-years cycle.

- Expected life length for men and women - a statistical measure, calculated with reference to a specific moment based on the actual ratio of the number of living and dead in separate age groups.

Section 2: Land and urban planning

This section covers issues related to sustainable urban planning and design in the country, development of territories and containment of urban growth, increasing the efficiency of production in urban and suburban areas, urban mobility, increasing technical capacity of planning and urban management.

Subsection 2.1. Ensuring sustainable urban planning and design

Planning of settlements plays a major role in ensuring that urban development and management of cities is in line with the goals of sustainable development. It is undoubtedly, that unbalanced spatial, urban planning can lead to huge negative economic, social and environmental consequences. Rational use of areas means the strictest economy in using urban lands, which means correct ratio of areas allocated for construction of buildings, landscaping, transportation, sports and other needs, as well as optimal density of residential buildings.

The Republic of Tajikistan is one of the world's land-poor republics (93 percent of the country territory is covered by mountains). But, despite this, agriculture is the main source of livelihood of people.

According to the law, the land in Tajikistan is the exclusive property of the state, and its effective use by the people is guaranteed.

Land plays a huge role in creation of wealth since it is the source of the existence of human society, the natural foundation of social management, which is directly related to the use of land as a spatial basis and mean of production. The land - as a natural resource - is an important component of the biosphere. It contains huge mineral deposits; water and forest resources are available on its surface. In agriculture and forestry, it is the main mean of production; and normal production is not possible without land. Limited land resources against population growth makes the problem of caring attitude and rational use of lands increasingly important. Comprehensive detailed natural, legal and economic study of the land is now of paramount importance. For this purpose land registry to be used.

State Land Cadastre (SLC) is economically important and designed for effective land use and protection, economy planning, distribution and specialization of agricultural production, land reclamation and chemicalization in agriculture, ensuring land market, legal certificates of land rights, etc. Maintaining the land cadastre in the Republic is the responsibility of the State Committee on Land Management and Geodesy of the Republic of Tajikistan.

In the framework of this process and for transition to market economy, as well as implementation of land reform and providing the population with its own food, two Presidential decrees were issued in 1995-1997 regarding allocation of 75 thousand hectares of land for household plots.

State Committee on Land Management and Geodesy of the Republic of Tajikistan (hereinafter referred to as the Committee) is the central body of executive authority responsible for the development and implementation of unified state policy in the sphere of relations relevant to state land survey works, land cadastre, topographic, geodesic, aerospace and cartographic works, state registration of real estate and the rights for it, state control over land use and protection, state control of topographic, geodesic and cartographic works.

The Committee is guided by the Constitution of the Republic of Tajikistan, the Land Code of the Republic of Tajikistan, laws of the Republic of Tajikistan "On Geodesy and Cartography", "On State Registration of Immovable Property and Relevant Rights", other laws of the Republic of Tajikistan, decisions of Madjlisi Oli of the Republic of Tajikistan, decrees and orders of the President of the Republic of Tajikistan, decrees and orders of the Government of the Republic of Tajikistan, international legal acts recognized by the Republic of Tajikistan.

For successful land reform and restructuring of agriculture, the following legislation and policy documents were adopted by the Government of the Republic of Tajikistan:

1. Regulation on the State Committee on Land Management and Geodesy of the Republic of Tajikistan, approved by the Government of the Republic of Tajikistan in 2010.
2. Law on Land Reform, adopted by Madjlisi Oli of the Republic of Tajikistan in 1992.
3. Program of economic reorganization of agriculture complex of the Republic of Tajikistan for 1995-2003 approved by the Government of the Republic of Tajikistan in 1995.
4. Land Code of the Republic of Tajikistan, adopted by Madjlisi Oli of the Republic of Tajikistan in 1996.
5. Programme for meliorative improvement of irrigated lands for 1998-2003, approved by the Government of the Republic of Tajikistan in 1998.
6. National Action Programme (NAP) to combat desertification, approved by the Government of the Republic of Tajikistan in 2001.
7. Provision on state control over use and protection of the lands of the Republic of Tajikistan, approved by the Government of the Republic of Tajikistan in 1997.
8. Law "On Land Assessment", adopted by Madjlisi Oli in 2001
9. Law "On Land Management", adopted by Madjlisi Oli in 2001.
10. The concept of land use in the Republic of Tajikistan, approved by the Government of the Republic of Tajikistan in 2004
11. The Law "On State Registration of Property and Relevant Rights", adopted by Madjlisi Oli in 2008.
12. The law "On Mortgage", adopted by Madjlisi Oli in 2008.

The Committee performs its activities in cooperation with central executive authorities, local executive authorities, public organizations and other natural and legal persons.

Information about Land Registration and Cadastre System Project

\$ 10.519 million. US dollars grant was allocated by the World Bank to the Republic of Tajikistan for the implementation of the original " Land Registration and Cadastre System for Sustainable Agriculture Project " (LRCSP).

The grant for the original project was approved on June 15, 2005 and entered into force on 28 September 2005. The date of closing of the project was 31 March 2012.

Extension of deadlines of the original project and additional funding (AF)

Due to the successful implementation of the original project and the need to develop not only agriculture, but also to improve the system of real estate registration in the Republic, according to the proposal of the Government of Tajikistan the World Bank extended the project until 31 March 2015 and allocated additional funding of \$ 10.0 mln. US dollars.

Grant Agreement for Additional Funding was signed on March 16, 2012.

Development goals under the project

The development goal under the project (PDG), is "*to expand the activities in reorganization of farms, in order to provide a greater number of people in rural areas with an opportunity to become independent farmers; increase the number of immovable property with protected rights and offer a plan for improving the system of rights registration for immovable property*".

Project institutional structure

Goals and objectives of the original project are implemented in project areas by seven Regional Land Cadastral Centers (RLCC).

As the result of additional funding, three existing RLCCs (in Gissar, Kulyab, Badakhshan) were expanded and one new City Center on Immovable Property Registration (CCIPR) was established in Khujand to improve the system of registration of immovable property and relevant rights in pilot areas.

Brief description of project components

Component A: Farmland Restructuring and Registration of immovable property Rights

- 1) Enhance and expand farmland restructuring activities, registration of certificates for land use rights and improvement of registration details required for registration of immovable property rights in a systematic, objective and transparent manner.

- 2) Build capacity for farmland restructuring and registration of immovable property rights by, without limitation, establishing and supporting RLCCs and CCIPR and implementing pilot activities.
- 3) Develop the national cadastre and support issuance and registration of land use certificates by establishing survey and mapping capacity and spatial databases.
- 4) Conduct regulatory analysis and investment planning to support reorganization of farms and registration of rights to immovable property.

Component B: Information for immovable property users and support for irrigation

1. Information for farmers and other immovable property users.

Educate the population of participating regions on the farmland restructuring process, land use rights, independent farm management practices, on the rights to immovable property and their registration.

2. On-farm Irrigation and Water Management.

Allocation of grants to WUA and farmers' organizations for on-farm irrigation and water management systems rehabilitation, including the retrofitting required due to the smaller size of farms, and strengthening their capacity to implement these activities by carrying out relevant works, procurement of goods and services, training and including operating expenses.

3. Environmental Land Management

Provide trainings to support:

- (a) improvement of cotton seed demonstrations and the associated dissemination of associated information;
- (b) capacity-building among local agricultural and environmental specialists to advise and train farmers in independent assessment and monitoring of environmental conditions and in implementation of improved agro-ecological practices (including Integrated Pest Management) for the enhancement of sustainable productivity.

Project Achievements

a) Legislative and regulatory framework

The project was directly involved in the development, submission and approval of the following normative legal documents:

On July 1, 2011, the Government decree of the Republic of Tajikistan No 341 "On introducing amendments and additions to the Government decree of the Republic of Tajikistan dated July 2, 2009, No 374", was adopted which provided a new form of land use right certificate. The new form allowed the project to fill in the certificates electronically.

On February 27, 2010, the Government decree of the Republic of Tajikistan No 105 was adopted, according to which, land use right certificates shall be issued by local authorities and the State Committee for Land Management and Geodesy of the Republic of Tajikistan within the period not exceeding twenty-five working days from the date of submission of the application;

"Rules of withdrawal of dekhkan farm members from dekhkan farms" - approved by the decision of the Board of the State Committee for Land Management and Geodesy of the Republic of Tajikistan on July 14, 2011, No 22.

"The procedure of technical examination of all types of land use cases", approved by the decision of the Board of the State Committee for Land Management and Geodesy of the Republic of Tajikistan on July 14, 2011, No 23.

"User's Guide on the procedure of allocating land shares to form new dehkan farm" - approved by the decision of the Board of the State Committee for Land Management and Geodesy of the Republic of Tajikistan on October 7, 2011, No 33.

Within the Additional Financing, **in collaboration with the specialists of SCLMG** in the implementation and step-by-step transition to a unified system of immovable property registration in the pilot areas, the Instruction "**On the Procedure and Specifics of system-based registration of immovable property and relevant rights in pilot areas**" was developed and then adopted by the Government decree of the Republic of Tajikistan on October 04, 2013, No 447.

The guideline "**Standard Operational Procedures**" that included 11 steps and 18 annexes providing for implementation of measures on systematic registration was disseminated among regional Project Implementation Centers.

- rules of registration of immovable property and rights to it (**adopted by SCLMG on 06.06.2014. No 24**);
- forms and management of registration;
- list of documents required for state registration of immovable property (**Finalized and included into the "Rules of registration of immovable property and relevant" adopted by SCLMG on 06.06.2014. No 24**);
- procedure of certification of registrars (**adopted by SCLMG on 05.06.2014. No 21**);
- grounds to order, and the procedure for, the expertise of the authenticity of documents submitted for state registration (**adopted by SCLMG on 05.06.2014. No 20**);

- forms of certificates and the document (certificate) of the state registration, extracts from the Register (**adopted by SCLMG on 05.06.2014. No 22**).

In the future, these normative legal acts will contribute to establishment of a unified system of immovable property registration not only in pilot areas, but also countrywide.

b) Project achievements in spheres of new technologies, production, etc.

Seven RLCCs were established and provided with office space, surveying, computer and office equipment.

Under the Additional Financing three RLCCs were extended (in Hissar, Kulyab, Badakhshan) and the Center for Immovable Property Registration (CCIPR) was established in Khujand in order to improve the system of registration of immovable property and rights to it in the pilot areas.

New specialists of RLCC and CCIPR and the specialists of the State Committee for Land Management and Geodesy of the Republic of Tajikistan (totally **327** people) were trained in modern technologies of geodesy (GPS) and mapping (GIS).

For the first time in the Republic of Tajikistan the new coordinate system - Universal Transverse Mercator Projection (UTM) – was implemented and being operated for land surveying and conducting geodetic and cartographic works.

21 geodetic network points of 1st class and 184 geodetic network points of 2nd class were established.

Modern electronic technology was implemented and the production of digital maps for land surveying, geodetic and cartographic works was organized.

9099 orthophotomaps were produced, including 221 boards of 1:10000 scale, 4778 boards of 1: 5000 scale and 4100 boards of 1:2000 scale for the total area of 4100 sq km. These orthophotomaps are being used by both project experts, and the specialists of the Committee for Land Management and Geodesy and its subordinate structures.

Since the second half of 2009, the project started to process land-related issues and land use right certificates electronically, that allows to prevent errors, reduces the costs, reduces the time for filling in the documents and improves the quality of the documents.

The project contributed to creation of 107 956 (until 15 December 2014.) individual and family dehkan farms and issued land use right certificates to them without charging fees.

224141 people were involved in education campaigns on land use rights and immovable property.

The number of heads of new households who participated in trainings on effective management of dehkan farms created under the Project totals to 14 673 people since the beginning of the project.

73 WUAs were established during the project, which restored in-farm irrigation networks on the area exceeding 12 thousand hectares.

Two-day trainings "On environmentally sustainable land use" were offered to local district specialists in environmental protection, agriculture, to land committees and water management units, as well to land surveyors of jamoats and technicians from NGOs. 1089 – is the total number of specialists involved in these trainings.

The implementation of the project was ended on March 31, 2014.

State Unitary Enterprise "Immovable Property Registration" was established.

Subsection 2.2. Territory management and containment of urban growth.

Spatial planning plays an important role in improving the efficiency of the use and organization of urban areas, their harmonious and thoughtful development, prevention of urban expansion.

In Tajikistan, the construction sector is overregulated. In addition, according to the annual survey of the World Bank «Doing Business», which defines the ratings of comfort building permit procedures, Tajikistan ranks 177 out of 183 countries. Construction of a warehouse in Dushanbe requires compliance with 32 procedures, takes 250 days and costs about 1.023% of the gross national income per capita. Detailed analysis of the Tajik legislation in the field of construction was prepared by the USAID in 2008. The report identified and analyzed the gaps and discrepancies in the legislation at each stage of the construction process, and administrative requirements were found redundant.

In order find the solution and encourage investment and improve Tajikistan's position in the ranking of the business environment, the year 2009 was announced by the President as the year of the construction sector reform. With regard to the administrative procedures, the principle of "one window" was implemented in the sphere of construction. It clearly defines the stages and timing of the receipt of all necessary permits and documents. In addition, it also minimizes the interaction with government and municipal structures. The process of improvement of legislation and simplification of administrative procedures related to construction, continued in 2010 with active support of a number of donor organizations. However, there is still a problem of supervision and monitoring of construction, especially of private construction.

The Committee for Architecture and Construction is responsible for development and implementation of state policy in the field of architecture, urban planning and construction. Specifically, the Committee is responsible for spatial planning, renovation of existing master plans, research in the areas of its competence and development of procedures for approving projects in the field of architecture, urban planning and construction.

Local executive authorities (hukumats) are responsible for development of complex schemes of territorial organization, master plans and detailed urban development plans in cooperation with the Committee for Architecture and Construction. They are also responsible for the allocation of land plots for construction projects in accordance with the Land Code.

Government authorities approve master plans of regional centers, Dushanbe and the towns and centers of the Districts of Republican Subordination. The Government is also responsible for submitting the complex scheme of administrative and territorial division for the approval of the Majlisi Milli (Upper Assembly of Parliament).

A. OBTAINING CONSTRUCTION PERMITS

At the time of gaining independence, the procedures for obtaining permits for construction were quite lengthy, bureaucratic and not transparent, even in comparison with those in other former Soviet republics. In order to improve and simplify procedures, the corresponding process was initiated in the construction sector in 2009. The Presidential Decree No 638 d/d 18 March 2009 "On improvement of administrative procedures related to construction activities in the Republic of Tajikistan" was aimed at developing simplified procedures for obtaining construction permits in order to enhance the effectiveness of the Law "On Architectural, Urban Planning and Construction Activities". According to the decree, the Government adopted the Governmental Decree No 282 d/d 6 May 2009 about new order of administrative procedures required to obtain building permits, which introduced the "One Window" principle.

The Committee for Architecture and Construction carried out the review of the list of documents required to obtain building permits and in June 2009 approved the updated forms for submission of applications to obtain building permits.

MASTER PLANS

In the 1990s, because of the civil war and due to economic and social problems, the activities related to the development of master plans mostly suspended. Since 2001 JSC "Shahrofar" resumed the process of updating and adjusting master plans in Tajikistan, since many of them were out of date or no longer in effect. The JSC "Shahrofar" is an authority under the Committee for Architecture and Construction, which is responsible for development of master plans. The organization runs in that capacity since the Soviet times, and in fact has a monopoly in this area of expertise.

Initially the JSC "Shahrofar" developed one or two master plans in a year, but then its capacity was enhanced and now it is able to submit up to 8-10 master plans in a year. The JSC "Shahrofar" also has its branch in the Sughd region, which is responsible for drawing up master plans of settlements located in that region.

The process of preparing master plans is implemented in cooperation with local authorities - Hukumats, which are responsible for providing information to "Shahrofar" about current situation in their settlements and plans for future development of territories. After the completion of each draft master plan, they are sent to government departments for comments. The payment for "Shahrofar" services shall be either entirely from budgets of local hukumats or - in case of financially weak regions - fully or partially from the state budget.

Participation of the population in decision-making in drawing up master plans is very limited. In addition, the information provided by local authorities on the current situation with master plans and their updating process is usually quite inadequate. This leads to misunderstanding among the population regarding the plans for construction of new houses and causes uncertainty about the future of existing dwellings. This, in turn, may cause additional issues related to illegal construction and eviction in such areas.

Mater Plan of Dushanbe

After becoming the capital of the Tajik Soviet Socialist Republic, Dushanbe quickly began to turn into a city with an ever-growing population. The number of residents of the capital in 2014 has already reached 575,900 people. At the same time, the borders of the city also changed significantly during the XX century. If initially the city developed on the left bank of the Dushanbe river, later it expanded to the west, to the right bank of the river and to the south-east. The first master plan of the city was developed in the 1930s by Russian experts, and since that time Dushanbe had several subsequent master plans.

Even though the master plan of Dushanbe of 1983 became inoperative, the period of its validity was extended by the Government in 2005 until the development of new master. In 2009, the Municipality of Dushanbe announced an open tender for the development of a master plan for the city. The winner was the Giprogor (Russian Institute of Urban Design in Moscow), which began working on developing the master plan.

Due to the civil war and economic stagnation in the 1990s, many components of the master plan of 1983 could not be implemented. The work on the new master plan should be considered as further development of the master plan of 1983 in terms of its updating, rather than drawing up a completely new document.

Subsection 2.3. Increasing the efficiency of production of products in urban and suburban zones.

In terms of protection and state support of entrepreneurship, one of the most important document is the Program of State Support of Entrepreneurship for 2012-2020, which is implemented to create favorable conditions for the activities of business entities, which represent one of the main factors of solving social and economic problems of the country.

The first phase of this program was completed during the 2012-2014 period. During this period, the set of the country's legislation in the field of entrepreneurship was improved, modernization of production and technological processes was gained, foreign and domestic capitals were attracted, state-private partnership was strengthened.

In 2015 the second phase of the program began, that should result in adoption of a number of new regulations.

Other important documents to support businesses in various sectors of the national economy are:

- Construction Companies Support Program aimed at improving investment and business climate in the construction sector for 2012-2014;
- Program on improving investment attractiveness in the sphere of subsurface resources management in the Republic of Tajikistan for 2012-2015;
- Program of Cotton Development in the Republic of Tajikistan for 2010-2014;
- Program of Poultry Development in the Republic of Tajikistan for 2010-2015;
- Program of Developing Breeding Industry and well-bred livestock in the Republic of Tajikistan for 2008-2015;
- Program of Developing Yak-breeding in the Republic of Tajikistan for the period of 2008-2015 years;
- Fishery Development Programme in the Republic of Tajikistan for 2009-2015;
- Horse Breeding Development Programme in the Republic of Tajikistan for 2009-2016;
- Beekeeping Development Programme in the Republic of Tajikistan for 2011-2016;
- Seed Development Program in the Republic of Tajikistan for 2010-2014;
- The Program of complete processing of livestock material in the Republic of Tajikistan for the period up to 2015;

- State program of developing potato growing in the Republic of Tajikistan for 2012-2016.

In order to support entrepreneurs by favorable financial resources, the State Institution "Entrepreneurship Support Fund" was established in 2013, and 63 million somoni was allocated from the state budget to the fund.

130 million somoni was allocated to the Fund in 2015, and up to 1 billion somoni is expected to be allocated within next 7 years.

To date, the Fund provided loans to 56 business entities in the amount of 48 million somoni, but this is still **not enough**.

Cities are key players in raising national productivity, which is the main factor of economic growth and prosperity. Main production and human capital of the country is concentrated here - the majority of the population works in cities and generates national wealth. In addition to industrial capacities, modern cities are also centers of science and education, places of concentration of the creative class - main supplier of innovative solutions.

Industry production (in monetary terms) as a whole and in its individual branches is defined as the sum of volume data of certain industrial enterprises. Production of industrial enterprises is considered as the value of ready products produced by the enterprise during the period under review, and released semi-finished products (produced of both own raw materials and raw materials of the client), and also the cost of works of industrial character performed on the orders from the outside or from non-industrial farms and the organizations of the enterprise. Own products spent for industrial-production needs within the enterprise are not included in the production of the industrial enterprise (with some exceptions).

Production of industrial products in natural units is usually shown as according to gross output, i.e. including products consumed for industrial production needs within the enterprise. The data on production of consumer goods (in current prices of respective years) includes food and non-food products and alcohol beverages. The level of utilization of production capacities is determined based on the annual average capacity during the reporting period, and on the production release, production or processing of raw materials.

Subsection 2.4. Urban mobility

Transportation and communication systems are essential for the movement of goods and people, information and ideas, access to markets, jobs, schooling and other services. However, urban mobility means not only the mobility of people, as measured by the amount of movement on foot or by truck, overcoming the urban space in the process of life, but also such factors as the availability of facilities and conditions for a change of one residence to another (for example, sufficient funds of rental housing, availability of jobs, etc.).

- ***Level of motorization and number of cars in private ownership per 1,000 inhabitants*** shows the possibility of the population to move to the urban space, regardless of the public transport. On the other hand, the process of motorization is associated with negative phenomena associated with underdeveloped road network, low traffic capacity of its separate parts, congestion of the transport network, traffic congestion, lack of a sufficient number of parking lots and garages.

COVERAGE OF THE POPULATION WITH INDIVIDUAL CARS

*per 1,000 of present population

Transport, as the kind of economic activity, is subdivided into general purpose transport and special use transport.

General purpose transport - transport that meets the needs of all sectors of the economy and the population in cargo and passenger traffic, moving various types of products between producers and consumers, providing public transport services to the population. Public transportation includes transportation on a commercial basis (for a fee) of passengers (including citizens entitled to free travel on general purpose transport) or goods. Transportation carried out by commercial organization, recognized as the carriage by general purpose transport, if the law, other legal acts or permits (licenses) issued to this organization state that this organization is obliged to make transportation of goods, passengers and luggage upon the request of any citizen or legal person.

Section 3: Environment & Urbanization

This section covers such issues as the impact of urban development on climate change, disaster risk reduction, reducing traffic congestion and air pollution in populated areas.

Subsection 3.1. Impact of cities on climate change

The effects of urbanization and climate change are combining dangerously, threatening ecological, economic and social stability worldwide. The share of greenhouse gas discharges by cities as the result of human activities (or man-made) can be from 40 to 70%. With further urbanization, the understanding of the impact of climate change on the urban environment will become increasingly important. According to accumulated evidences, climate change creates unique challenges for the cities and their growing populations. These effects are the result of the following climate changes: more frequent hot days and nights, fewer cold days and nights in many parts of the world, increased frequency of significant rainfalls, increase in areas prone to drought, increased intense tropical cyclone activity, more frequent cases of abnormal sea level raising. Therefore, the following documents are adopted and in force to address these problems in the country:

- The first National Declaration on Climate Change;
- State Program on Development of Specially Protected Natural Areas for 2005-2015;
- Forestry Development Programme of the Republic of Tajikistan for 2006-2015 (2005);
- The Concept of the Republic of Tajikistan on the transition to sustainable development (2007);
- State Program on Study and Conservation of Glaciers in the Republic of Tajikistan for 2010-2030 (2010);
- State Program on Environmental Monitoring of the Republic of Tajikistan for 2010-2030 (2010).

These programs are aimed at solving environmental problems, such as preventing land erosion, rehabilitation of air and water quality, introduction of new technologies in industrial production (acceptable from the point of view of the environment and energy efficiency), further increasing the welfare of the population, addressing adverse effects of climate change and ensuring sustainable development and protection of biological diversity.

State Ecological Program of the Republic of Tajikistan for 2009-2019 is a key state document that defines main directions of sustainable development of society, maintaining the balance between natural resources and relevant users, organization and coordination of relations between natural resource users and the nature, healthy development of the society, rational use of natural resources and ways to restore destroyed ecological spaces. Implementation of the measures under the Programme provides an opportunity to solve the issues of rational use of natural resources and environmental protection, as environmental issues still remain unresolved in the society.

The Program provides for the transition of the state to the period of stable development, enhancing socio-economic level along with involvement in the turnover of new and large-scale natural resources (land, water, air, plants, forests, mineral resources). Therefore, strict accounting of environmental factors is needed in the conditions as below:

- increasing population and relevant mismatch with the level of production development;
- issues of environmental capacity (space, territory, water area), and the location of the individual unique natural sites and other ecological processes when planning the placement of production and production forces.

- Fixed capital investments aimed at environmental protection and rational use of natural resources determines the interest of governments and the effectiveness of management in the field of environmental protection.

The main purpose of introduction of economic mechanisms of nature management consists in regulating relations between nature users and the nature and the observance of norms, standards and requirements of rational use of natural resources, and also providing protection of natural resources.

Economic measures for environmental improvement consist of the following activities:

- natural resource users must themselves pay environmental fees for the use of natural resources, directly or indirectly - for the deterioration of natural resources;
- according to regulations, for exceeding the limits (regulatory, technological) of emissions, nature users shall pay in 5 and 10-times amount;
- maximum acceptable level of production costs shall be considered when fixing wholesale and purchasing prices for products;
- analysis and evaluation of resource and economic potential of cities and regions and economic costs of environmental pollution;
- development of recommendations on improvement of the economic mechanism of rational use of nature, protection and improvement of the environment and human health at district level based on the legislation of the Republic of Tajikistan about local government in order to improve the mechanism of nature use;
- consideration and analysis of productive forces and their location, taking into account ecological capacity of areas;
- consistency of socio-economic development programmes; distribution of productive forces based on this Program;

- in accordance with the standards and technologies, main economic indicators of rational nature use are the control figures which are included into the balance of volume of output products plus the volume of used raw materials;
- higher-than-normal indicators should be considered as the violation of laws of economics and environmental protection;
- stimulate activities of those private and public sectors, which take into account environmental values and specify environmental values for producers or nature users, and also include the costs associated with conservation and environmental protection into total costs;
- establishment of interagency mechanisms necessary for the development and use of financial incentives aimed at promoting environmental protection, as well as to assess their effectiveness.

- Availability of environment protection programs at national and local levels (use of renewable energy sources, reduction of emissions, waste recycling, formation of tariffs for water) shows the interest of governments to reduce the negative impact of cities to the environment.

Tajikistan is one of the world centers of mountain glaciers, the richest source of fresh water and one of the world's ancient centers of agriculture and biodiversity.

The unique mountain ecosystems in Tajikistan combined with large deserts and semi-deserts of the region, contribute to the formation of the region's climate and rich and globally important flora and fauna.

Currently, main environmental issues in Tajikistan are handled through the State Ecological Program of the Republic of Tajikistan for 2009-2019.

The objective of the program consists of the following measures:

- involve state, public and private organizations to improve environmental situation of the country;
- education of all sections of the population, irrespective of their political and religious views, to improve ecological situation in the country and provide rational use of natural resources;
- conducting measures to prevent erosion of lands;
- preventing the increased use of lands for less productive crops;
- expansion of forest areas, gardens, green areas and the promotion of their sustainable use;
- organization and expansion of protected areas;
- introduction of new varieties of high-yield, disease-resistant crops;
- providing clean air, water and natural resources management;
- gradual conversion of industry into local eco-friendly production and less

energy demanding materials;

- promoting the use and development of low-waste technology;
- strengthening control to reduce emissions to the allowed limit level and below;
- involvement of ministries, departments, nature users and international organizations in financing environmental programs;
- creation of environmentally clean areas to improve public health.

In accordance with the decision of the Government of the Republic of Tajikistan, the implementation of the Programme is the responsibility of all ministries, departments, enterprises, institutions, organizations and economic establishments, including joint ventures, regardless of ownership and subordination, whose activities are related to nature and relevant impacts on the environment in the Republic. Environmental authorities are responsible for coordinating and monitoring the implementation of this Program.

The Program is a mechanism for regulating environmental situation in the Republic of Tajikistan and represents a binding document for natural users as regards solving environmental issues in their activities.

- The presence of normative legal acts in the field of environmental protection, increase of energy efficiency in various sectors of the economy, reducing harmful effects of human activities on the environment determines the level of management efficiency and inter-sectoral cooperation in the field of reducing "ecological footprints" of cities.

Significant role in achieving the goals of environment protection and rational use belongs to unified environmental standards and rules of nature-using economic activities, compliance with which ensures fulfilment of environmental legislation of the Republic.

The role of norms and rules on environmental protection in the field of capital construction is of particular significance as it ensures expanded reproduction of fixed assets.

Norms and rules on environmental protection enable the implementation of environmental legislation requirements in the form of regulatory technical documents used in development, manufacturing and consumption of products (energy, new technologies, materials, substances, etc.), as well as defining new locations, designing and construction, reconstruction and operation of existing facilities and complexes.

The concept of environmental standards and regulations is aimed to ensure that environmental management comply with the objective and logical existence and development of the environment.

Therefore, environmental standards and regulations shall create a system of uniform

(standardized) regulations, compliance with which ensures normal functioning of natural territorial complexes (landscapes), components of the environment (atmosphere, hydrosphere, lithosphere, flora and fauna) with the purpose of conservation and reorganization of the environment, as well as rational use of natural resources.

Due to the increasing demands of ecology in environmental management, it is needed to create a solid foundation of environmental rules, regulations and nature conservation standards, as well as a unified system of environmental standardization. The following should be addressed in the near future:

- develop a common provision on environmental standardization, which should determine the content, functions, objects, legal status of norms, regulations and standards;
- integrate the areas and forms of organization of various environmental regulations and standards into single system, which should provide their consistency and suitability for use in the field of management and economic activity planning;
- develop principles and methods for preparation and justification of environmental regulations and standards, which take into account up-to-date achievements in the field of engineering and technology, as well as natural properties of nature; define the process of development, expertise, coordination and practical implementation of environmental regulations and standards;
- carry out zoning of the territory of the Republic with the purpose of environmental regulation and standardization based on the account of peculiarities of economic use of territories and natural properties of resistance to various anthropogenic pressures;
- develop centralized standards for anthropogenic loads on the environment and its components for large natural-economical areas of the country;
- create a republican geological information system which ensures continuous monitoring, development, adjustment and examination of environmental norms and standards;
- development and adoption of laws and regulations related to environmental insurance;
- compliance with quality standards of international conventions;
- articles on protection of the environment shall be included in all legislative regulations of privatization;
- it is necessary to organize the practice of returning glass, plastic bags, etc, in sales points;
- strengthen discipline and reliability of ecological and environmental reporting in all ministries, departments and banking operations;
- when fixing prices for products is necessary to include environmental factor in the amount of not less than 3 percent of the cost of the product in the form of environmental taxes.

Existing legislative acts in the field of environmental protection:

1. Law of the Republic of Tajikistan "On Environmental Protection"
2. Law of the Republic of Tajikistan "On Environmental Monitoring"
3. Law of the Republic of Tajikistan "On Environmental Information"
4. Law of the Republic of Tajikistan "On Ecological Education of the Population"
5. Law of the Republic of Tajikistan "On Licensing System"
6. Law of the Republic of Tajikistan "On Licensing of Certain Activities"
7. Law of the Republic of Tajikistan "On Other Obligatory Payments to the Budget"
8. Code of the Republic of Tajikistan on Administrative Offences
9. Law of the Republic of Tajikistan "On Preservation and Use of Plant Life"
10. Law of the Republic of Tajikistan "On Wildlife"
11. Law of the Republic of Tajikistan "On Mineral Resources"
12. Law of the Republic of Tajikistan "On Production and Safe Handling of Pesticides and Agrochemicals"
13. Law of the Republic of Tajikistan "On Specially Protected Natural Areas"
14. Law of the Republic of Tajikistan "On Environmental Expertise"
15. Law of the Republic of Tajikistan "On Production and Consumption Waste"

Subsection 3.2. Reducing risk of disasters

Many settlements are located in areas subject to the risk of adverse environmental impacts. High concentration of population in major cities located in close proximity to potentially dangerous areas may cause huge number of victims and enormous material damage in case of natural disasters.

Subsection 3.3. Reducing the number of traffic congestions

Advanced traffic management systems can improve the efficiency of road networks and increase the number of road vehicles using those roads without the formation of traffic congestions. This is particularly important for the cities where the percentage of urban lands, allocated for roads, is small. The tendency to expand the road network leads to the disruption of existing body the city and resettling a large number of residents. In this situation, the way out could be the introduction of new and effective lines of public transport into the city structure. Direct dependence on the effective planning is also visible here – the increase of building density contributes to the creation of compact urban spaces and allows to reduce daily travel.

-Level of development of alternative transport

The Republic of Tajikistan is a country with predominantly rural population. However, the problems of big cities also take place in the country, especially in the capital. Difficult economic situation established after military operations in the country greatly exacerbated the problem of roads, which were not repaired for years. In recent years, the Government invested a lot in the repair of road pavement. But there is still much to do to prevent congestion. The structure of public transport is that it is dominated by cars, minibuses and taxis, while buses and trolleybuses

gradually lose their ground. This can not be allowed, since from the environmental point of view, buses and trolleybuses are more environmentally friendly. On the other hand, minibuses and cars severely degrade traffic capacity by creating additional load and congestion.

Proportion of passenger transport in Dushanbe

To improve the current situation in the country is necessary to conduct the following activities:

1. Firstly to restore the trolleybus park for at least up to 250 units in the city of Dushanbe, and up to 150 units in the city of Khujand.
2. Increase the number of buses using engines running on natural gas (methane).
3. Improve the quality of road surface, to build bypasses for transit and cargo transport, improve the infrastructure of roads, construct additional parking lots, etc.
4. Create additional paths for cyclists,
5. Create multi-level junctions in the most stressed parts of the city.

As an alternative form of transport it can be offered to run electric trains or speed trams (due to the impossibility to build a metro).

- Availability of programs at national and local levels aimed at developing public transport system determines the effectiveness of management in improving comfort of living and resources.

- Renewal of electric transport shows the interest of authorities in development of sustainable modes of transport.

In connection with the situation, related to the dynamic growth of the population of the Republic of Tajikistan, which affects the population's need for private immovable property, including the need for job places, increase of personal property per capita, which in turn affects traffic capacity of the road infra-structure, as well as

considering that the existing architectural infrastructure was developed and constructed during the time of the Soviet Union, which is now no longer relevant, target programs of development of cities and towns were developed by the cities and large settlements of the Republic and approved by decisions of the Government of the Republic of Tajikistan.

Currently, in accordance with the objectives, stage-by-stage construction of multi-storey, modern apartment buildings, including the construction of kindergartens, schools and various objects of economic-productive activities is carried out on the place of dilapidated housing buildings in accordance with international standards. Also, along with the above mentioned works and in order to meet the population's needs in transport and road infrastructure, the reconstruction (expansion) of existing roads, including the allocation of lanes for bicycles is carried out as well.

Main directions of developing transport complex of the Republic of Tajikistan were specified in accordance with the "State Target Program on Development of Transport Complex of the Republic of Tajikistan until 2025", which was approved by the Decree of the Government of the Republic of Tajikistan, No 165 on April 1, 2011. Main indicators of transport complex development are the renewal of rolling stock, development and improvement of road infrastructure, development of logistics and terminal types of services, which also aimed at protecting the environment, gradual transfer of vehicles to alternative fuel (condensed gas), etc. Currently at the expense of local executive branch of the Government in Dushanbe, legal entities and private entrepreneurs, the update of rolling stock park (freight and passenger vehicles) including electric transport is continued. Last year, the plant on assembly of trolleybuses was opened in Dushanbe, that in the future will allow to satisfy the needs of users of this type of transport in the capital and cities of the Republic.

It should also be noted that in 2014 local executive authorities of Kulyab and Kurgan-Tube and the Russian company "TROLZA" signed protocols of intent regarding the establishment of traction units with appropriate infrastructure for arranging trolleybus service in these cities.

It should also be noted that in accordance with the concept of transport complex development up to 2020-2025, the construction of trolleybus park, traction network and substations is planned in cities of Vahdat, Tursunzade, Hissar district and Somoni settlement.

Tajikistan, due to its natural geographical conditions, represents a great interest - being located in the heart of Asia, on the world known crossroads of the Silk Road, Tajikistan may become a bridge connecting the countries of south-east Asia with the countries of the Middle East and Europe.

The main goal of economic transformations of the Republic was to create favorable conditions for structural reforms, restoration of most important areas of infrastructure.

Taking this into account, investment projects on construction and full reconstruction of road networks, construction of tunnels and bridges totaling to more than \$ 1.1 billion were attracted and implemented by international financial institutions in the period 2006-2015. In the longer term 7.3 billion US dollars are planned to be attracted for the development of transport infrastructure.

After the collapse of the Soviet Union and related economic difficulties, the electrotransport industry of the country went into decline. The electrotransport, that was operated or planned to start operating in the cities (for the exception of Dushanbe) and towns of the country, currently no longer exists or was not further developed. Volumetric values, compared to general volumes are not large. According to operational data of the State Committee for Statistics under the President of the Republic of Tajikistan, in 2014 the volume of passengers transported by electrified transport was 1.88% as compared to other public transport.

As the result of implementation of the concept of development of transport complex of the Republic of Tajikistan until 2015, which provides for the creation of trolleybus park, traction network and substations in cities of Kurgan-Tube, Kulob, Vahdat, Tursunzade, Hissar district and village Somoni, the volumetric indicators have improved; it is also worth noting, that the implementation of the approved concept in the long term will have a positive impact on the environmental security of the country.

Subsection 3.4. Air pollution in settlements

The main source of air pollution has become automobile transportation, since the number of units operated by motorized transport increased dramatically, while in heavy industry there was the downturn and drastic measures were taken to restrict the use of coal and oil in order to combat air pollution caused by combustion products of these fuels.

- ***Presence of developed air pollution monitoring system*** shows the effectiveness in the field of environmental management.

Main air pollutants in cities and villages of the republic are mobile sources of emissions, mainly road transport. Since 1997, the volume of exhaust gases from internal combustion engines (ICE) have a general tendency to increase. This is due, above all, the condition of city vehicles: car park is noticeably worn, most of

vehicles are in service for 10 years or more. On the other hand, total number of vehicles, especially passenger cars, in the private sector has increased.

Condition of atmospheric air of the city is controlled by fixed monitoring stations. During Soviet time in Dushanbe there were 8 units, but currently only 2 (and 5 in other cities of the republic) are operated. These posts measure the levels of concentration of carbon monoxide, nitrogen oxides, sulfur dioxide, formaldehyde and dust. Existing pollution monitoring points (PMP) do not cover the entire territory of the city of Dushanbe.

Termination of supply of natural gas from Uzbekistan led to the situation, when heating power stations and major industries (aluminum plant, cement and other industries) were forced to move to solid fuels, mainly coal. This seriously affects the quality of ambient air, as the emissions from coal combustion in times greater than those of natural gas.

- ***Air pollution index in the trend*** shows the effectiveness of activities aimed at protecting air basin.

Despite a satisfactory situation as a whole, the current state of the air basin in settlements is alarming.

On a number of objective reasons, indications of monitoring posts can not be accurate and reliable because of:

- a) little coverage in the city area (two posts instead of eight);
- b) lack of qualified specialists who maintain monitoring posts;
- c) low technical level of analytical equipment, reduced number of ingredients which could be found in the air, and other reasons.

To reduce emissions in the settlements the following steps are required:

- Organization and monitoring of air pollution from motor vehicles is possible if to increase in several times the number of observation posts and raids conducted
- Strict control of exhaust emissions from motor vehicles and emission sources in industrial enterprises
- Strengthening control over the quality of fuel and lubricants at gas stations of the city, prohibition of importation and release of petroleum products which do not meet the requirements of the State Standard.

Stationary sources of emissions of harmful substances into the air - immobile technological units (installations, devices, machines, etc.) which emit harmful

substances during operation. This includes terricones, tanks, and other objects that emit harmful substances.

Organized sources of emissions of harmful substances are the sources from which harmful substances enter the flues or duct system (pipe, aeration lantern, ventilation shaft, etc.), and the system allows to use gas and dust removal system for their respective capture.

Harmful substance, pollutant - a substance, which presence in the atmosphere has an adverse impact on the environment and human health.

Source of harmful substances emissions - technical equipment (installations, aggregates, machines, devices, galvanic baths, etc..) or processes (moving bulk materials, trans-fill of volatile substances, welding, painting works, etc..) which, during the manufacturing cycle, emit harmful substances; also places of storage of bulk or liquid materials, quarries, waste dumps, industrial waste storage sites, which emit harmful substances under the influence of meteorological factors.

Emissions source - a special device: pipe, aeration lantern, ventilation shaft, etc., by means of which the emission of harmful substances is done into the atmosphere.

Number of captured harmful substances - portion of the exhaust of a harmful substance extracted from the exhaust gas (ventilation air) as it passes through the dust and gas catching facilities.

Gross emissions of harmful substances - the value of the mass of harmful substances from the waste source for a certain (reporting) period of time.

Gross pollutant emissions - part of a total allocation of harmful substances released into the atmosphere during the reporting period.

Exhaust gas - a gas flow from the harmful substances sources.

Ventilation air - orderly flow of air containing harmful substances coming from the work area directly into the atmosphere or in gas ducts (ducts) as a result of the ventilation system operation.

Sources of emissions, depending on the equipment of special facilities with gas output (devices) are divided into organized and unorganized.

Unorganized sources include sources, which harmful substances go directly into the atmosphere as a result of leakage of process equipment, transport equipment and tanks. This includes burning terricones, dusty piles, etc.

Dust and gas cleaning plants - a set of equipment designed to remove or neutralize harmful substances of exhaust gases or air vent.

Amount of solids coming from stationary sources, includes both substances collected in the gas extraction system, whether they are directed to dust filters, or released directly into the atmosphere. This does not include the substances contained in process gases and those specially captured for production.

The composition of harmful substances released into the atmosphere by stationary sources includes the total amount of all contaminants coming to air basin both after treatment at dust and gas cleaning installations (as a result of insufficient capture and treatment), and without treatment (from organized and unorganized sources).

EMISSIONS OF HARMFUL SUBSTANCES INTO THE ATMOSPHERE (ON INGREDIENTS)

Section 4. Management and Legislation

This section covers such issues as improvement of urban legislation, decentralization and strengthening the role of local authorities, encouraging participation in the process of urban development, increasing security in the cities, ensuring social participation and equality.

Subsection 4.1. Improving urban legislation

Tajikistan pays due attention to the improvement of legislation which promotes development of urban development.

It should be noted that in 2013 the Parliament of the Republic adopted the Urban Development Code of the Republic of Tajikistan, which summarizes all legal, technical, organizational and other issues of architecture and construction development. In addition, more than 1,500 normative technical documents, including 125 construction norms and rules, 774 State Standards and more than 220 documents on formation of prices in construction are in effect in Tajikistan to address technical and pricing issues.

In order to objectively assess the costs of projects under construction, the Committee for Architecture and Construction under the Government of Tajikistan carries out monitoring of prices for basic construction materials and equipment on a quarterly basis.

In recent years, effective measures are taken to ensure using of international, European and Olympic regulations on design and construction of residential, public, industrial, social and other buildings. The National Library, National Museum, Dushanbe-Plaza, Republican multi-field hospital, sports palaces, administrative buildings of the Ministry of Foreign Affairs, Tax Committee, Committee of Youth Affairs, Sports and Tourism, hundreds of schools and residential buildings were built in accordance with these regulations and standards.

Government of Tajikistan pays due attention to spatial planning and urban management. Thus, master plans for more than 28 cities and district centers were developed and approved in recent years.

Due to the fact, that 93 percent of the republic's territory belongs to mountains, and with a view to economy lands for building construction, the decision was made to construct high-rise buildings. Currently, 2-4 storey houses in the capital of the Republic are being demolished and 9-18 story modern buildings are being

constructed in their place. Construction of 25-30-storey administrative and public buildings has already started in the center of Dushanbe.

Subsection 4.2. Decentralization and strengthening the role of local authorities

Currently, many countries carry out, and continue to carry out a variety of decentralization policy options. This process has very diverse forms. There are strong and convincing arguments for the local authorities in favor of decentralization, whether it is privatization of services or transfer of functions and responsibilities to the local level. However, any redistribution of responsibilities and financial authorities from one management level to another or from one body to another brings both benefits and losses.

Subsection 4.3. Encouraging participation in urban development

The partnership makes it possible to use on a shared basis the resources of national government agencies, municipal authorities, NGOs, private sector and citizens. There is a wide range of different partnership links between the public and the private sector in the field of urban development, construction, operation and maintenance of housing.

Subsection 4.4. Improving security in cities

Negative processes in the socio-economic sphere, such as reduced income, social inequality, family circumstances, unemployment, lack of medical facilities, etc. result in increasing level of crime. Urban safety is also determined by the possibility of safe use of urban space by physically vulnerable groups.

Registered crime – is a revealed and officially registered socially dangerous act under criminal law.

The Ministry of Internal Affairs of the Republic of Tajikistan registers crimes and the individuals who committed crimes, as well as and criminal cases.

The number of convicted persons includes those persons, in respect of which the courts brought in the verdict of guilty, which entered into legal force.

In recent years, the Government of Tajikistan and the Committee for Architecture and Construction does much to ensure that persons with disabilities have the opportunity to have an independent life on an equal basis with others, and that they always have access to physical environment, to transportation, to information and communications, including information communications technologies and systems, and to other facilities and services open or provided to the public, both in urban and

in rural areas.

Creating living environment accessible for disabled people is an integral part of the social policy of our state.

People with disabilities in the Republic of Tajikistan enjoy full social, economic, political and personal rights and freedoms recognized by the Constitution and other legislative acts of the Republic of Tajikistan.

We understand that for the productive life of "low-mobility" of people, especially with serious disabilities of musculoskeletal system and seeing and hearing, there is a need for significant change of infrastructure, that in turn requires significant financial costs.

Experts assure that the cost of additional works on providing easy access to buildings and facilities is included in the project cost of construction, reconstruction or major repairs, and according to international experience, this increases the estimated cost by 5-6%. However, creation of living environment accessible to people with disabilities has much greater economic impact. According to experts, under average efficiency of rehabilitation of a disabled, the expenses of creating affordable living environment for disabled people get regained within 5-10 years. The state system of measures, formed in recent years in the field of urban planning and production of technical aids, public passenger and private transport, communication and computer science aims at gradual creation of a barrier-free living environment for disabled persons. We must respect the laws of our country and do everything possible to ensure that people with limited mobility do not feel themselves invalid.

The legislation of the Republic of Tajikistan defines the requirements for authorities and organizations, regardless of their organizational-legal form, to provide conditions for people with disabilities for unrestricted access to the objects of engineering, transport and social infrastructure, information, as well as the responsibility for failing to fulfill these requirements.

So far, the conditions for unhindered access of disabled people and other people with limited mobility to social infrastructure, public and industrial buildings and structures are not fully provided in the settlements of the Republic of Tajikistan.

Considerable part of previously commissioned residential housing, shops, clinics, hospitals and other social service facilities does not take into account visits by citizens with disabilities.

Transport communications in cities are partially adapted to the capabilities of people with disabilities and other people with limited mobility. Pedestrian crossings in most cases do not provide for movements of disable people in wheelchairs, and raise additional difficulties for passage of wheelchairs. Traffic lights have no signaling

devices for the disabled.

Therefore, the accessibility of the environment for disabled people and people with limited mobility is one of the most important socio-economic problems, which need to be addressed as appears both from the requirements of the national legislation and international obligations of the Republic of Tajikistan.

Activities related to the implementation of accessibility requirements for people with disabilities and other low mobile population groups in the Republic of Tajikistan are regulated by numerous laws and regulations, of which the main ones are:

1. Law of the Republic of Tajikistan "On Social Protection of Disabled People" dated 29 December 2010, No 675 (Bulletin Majlisi Oli RT 2010., No12, p. 1, p. 834).
2. Town Planning Code of the Republic of Tajikistan dated December 28, 2012, No 933.
3. Decree of the Government of Tajikistan d/d 06.05.2009. No 282 "On Measures to Implement the Decree of the President of the Republic of Tajikistan "On improvement of Administrative Procedures related to Construction in the Republic of Tajikistan".

In accordance with Article 4 of the Law of Tajikistan "On Social Protection of Disabled People" the Coordinating Council for Social Security of Disabled People was established by the Decree of the Government of the Republic of Tajikistan dated December 31, 2011, No 682. The Coordinating Council was established to coordinate the activities of ministries, agencies and non-governmental organizations towards the implementation of state policy in the sphere of social protection of disabled people.

In accordance with item 2 of Article 25 of the Law "On Social Protection of Disabled Persons", the planning and construction of cities and other populated areas, the formation of residential areas and recreation areas, the development of design solutions for new construction and reconstruction of buildings, structures and their complexes are not allowed without adaptation of such objects for access and use by people with disabilities.

According to item 1 of Article 4 of the Town Planning Code of the Republic of Tajikistan, fundamental principles of urban development activities in Tajikistan particularly include:

- responsibility of bodies of the executive power, public authorities of communities and villages to ensure favorable livelihood conditions of the population living in particular area, to ensure that the settlements have engineering, transport and social infrastructure of recreational purpose which is not below then the specified by town planning rules and regulations on population service for such type of populated areas, as well as land improvement facilities;

- providing conditions for unrestricted access of people with disabilities to the objects of social and other purposes.

In accordance with item 6 of Article 6 of the Town Planning Code of the Republic of Tajikistan, the interests of society, the state, individuals and legal entities in the field of urban planning to be fulfilled by implementing the requirements of town planning rules and norms, and other normative legal acts, urban planning documentation, as well as the control to be carried out over such implementation.

Also in accordance with item 1 of Article 9 of the Town Planning Code of the Republic of Tajikistan, during urban development activities and in case of violation of town planning legislation, individuals and legal persons have the right to make a call for lifting of the permission for location, design, construction, reconstruction and commissioning of buildings, structures and other objects.

In accordance with item 6 of Article 64 of the Town Planning Code of the Republic of Tajikistan, the exclusive jurisdiction of the State Expertise includes expertise of justifications for investments, techno-economic justifications and calculations of project documentation intended for construction of objects (complexes), which, in particular ensure access of persons with disabilities to social, transport and recreational infrastructure, regardless of the sources of construction financing.

Activities related to the implementation of accessibility requirements for people with disabilities and other low mobile population in the Republic of Tajikistan are regulated by numerous regulatory and technical documents, which include:

1. Building Regulations MKS RT 30-01-2007*. Town planning. Planning and Construction of Urban and Rural Settlements.
2. Building Regulations MKS RT 31-01-2005. Residential Apartment Buildings.
3. Building Regulations MKS RT 31-02-2006. Public Buildings and Facilities.
4. Inter-state building codes IBC 3.024.5-2003. Accessibility of Buildings and Facilities for People with Limited Mobility.

It should be noted that the Republic of Tajikistan is being prepared for accession to the UN Convention on the Rights of Persons with Disabilities, which is based on the principles of full and effective involvement of disabled people in the society, equal opportunities and access to no-barrier environment.

To address the issues related to the accessibility of buildings for people with limited mobility, the Committee for Architecture and Construction under the Government of Tajikistan closely cooperates with various associations of persons with disabilities and non-governmental organizations.

For example, a joint action plan of the Committee for Architecture and Construction

and the Republican Society of the Disabled was developed and approved. Joint inspections and raids are carried out as a part of these activities to construction sites in order to ensure the fulfillment of requirements of construction projects related to protecting groups of people with limited mobility, and workshops and trainings are offered.

The Committee developed a few typical (pilot projects), which take into account the interests of all categories of persons with disabilities as much as possible.

NGOs fund more than 10 pilot projects and objects, where all related rules and regulations (SNiP-s) and legislation acts will be taken into account.

In addition, a multifunctional center - which is accessible to persons with disabilities – was established on the basis of the Society of the Disabled of Dushanbe with the support of the Japan Association for Support and Assistance. With the support of this organization and in order to implement inclusive education, ramps and accessible toilets were installed in schools No 74 and No 28 in Dushanbe. Favorable conditions for movement of persons with disabilities were provided in the Clinic No 12 at the Central Mosque in cooperation with Tajik Centre for Mine Action, FSD and with the support of UNDP. It should be noted that the projects under construction in Dushanbe are monitored on a quarterly basis. Participation in such monitoring provides a real opportunity to correct errors and defects in the construction and commissioning of facilities.

To solve the problem of improving accessibility of priority facilities and services in the priority spheres of life of persons with disabilities and other low mobile populations, it is necessary to provide the implementation of the following measures:

- Bringing the conditions of buildings and structures in conformity with the requirements of relevant building norms and rules in order to ensure their accessibility for people with disabilities and other low mobile populations;
- Adaptation of entrances, stairs, ramps, traffic routes inside buildings, service areas, sanitary premises and adjacent areas;
- Equipping buildings and structures with elevators and hoists with a voice announcement system and spatial raised signage;
- Equipping buildings and constructions with fire alarm systems and alarms with redundant lighting devices, boards with tactile information (space-relief), etc.;
- Preparation of teaching materials on the organization of accessible environment for people with disabilities and other low mobile populations at cultural institutions and offering training workshops for experts in these institutions.

Dissociation of people with disabilities and people without disabilities do not allow to fully create conditions for equal participation of persons with disabilities in all spheres of society. To solve this problem it is necessary to provide for the implementation of the following measures:

- preparation and carrying out representative sociological studies on the assessment by the disabled people of the attitude of citizens in the Republic of Tajikistan towards problems of the disabled; assessment by the disabled people of the availability of priority facilities and services in priority spheres of life;
- organizing and conducting public awareness campaigns for the dissemination of ideas, principles and means of forming accessible environment for the disabled and other people with limited mobility; preparation and publication of educational, information, advisory, methodological guidebooks and guidelines for creating accessible environment.

It should be noted that the implementation of a set of measures aimed at creating conditions for unhindered access to the priority facilities and services in priority areas of life of persons with disabilities and other low mobile populations will attract public attention to the needs and concerns of the persons with disabilities, will contribute to improving their quality of life and will allow to achieve the expected social impact, which has equal importance for persons with disabilities, and for the society as a whole.

As a result of implementing conceptual bases of the recommended measures it is possible to increase the level of access to health, education, culture and art facilities and city infrastructure.

In addition, the positive effect will be not only in improving the quality of life of persons with disabilities, but also in raising the general level of comfort environment for a much wider range of people, particularly the elderly, and persons suffering from temporary mobility limitations, including children.

Section 5. Urban Economy

This section covers issues related to municipal financing, improving the housing financing system, support for local economic development, creating jobs and ensuring a decent level of salary, integration of urban economy into the national economy.

Subsection 5.1. Improving municipal local funding

- *Investments in fixed capital per capita* determine the share of national wealth per capita and thus the level of welfare of the population.

Subsection 5.2. Providing access to housing finance

- The share of capital investments in housing construction in the total volume of investments – is one of the key development indicators of the housing sector.

Investments in fixed assets represent a set of costs allocated to the acquisition, creation and reproduction of fixed funds.

In accordance with the production structure and specificity of fixed assets, investments in fixed assets can be defined as the cost of construction, installation, design and survey works, purchase of equipment, both included and excluded in construction estimates, requiring and not requiring installation, as well as production tools and inventory, working and productive livestock, planting and cultivation of perennial fruit crops, forest belts and other expenses included in investments in fixed assets.

Subsection 5.3. Support for local economic development

Growth rate of establishing small and medium businesses

According to the Tax Committee under the Government of the Republic of Tajikistan, 263 598 units of business entities were registered in the country in 2013, which has increased by 27,157 units or 91.3% compared to 2006. The dynamics can indicate a positive growth rate of the number of entrepreneurs, operating on the basis of patents (9.4%) and certificates (18.5%) in 2006, and by 2013 this figure is reduced by acquiring a negative value (-10.5% and -5.9%, respectively). However, if we compare the figures of 2013 with 2006, we can see a positive growth rate in the number of entrepreneurs, operating on the basis of patents (14.1%).

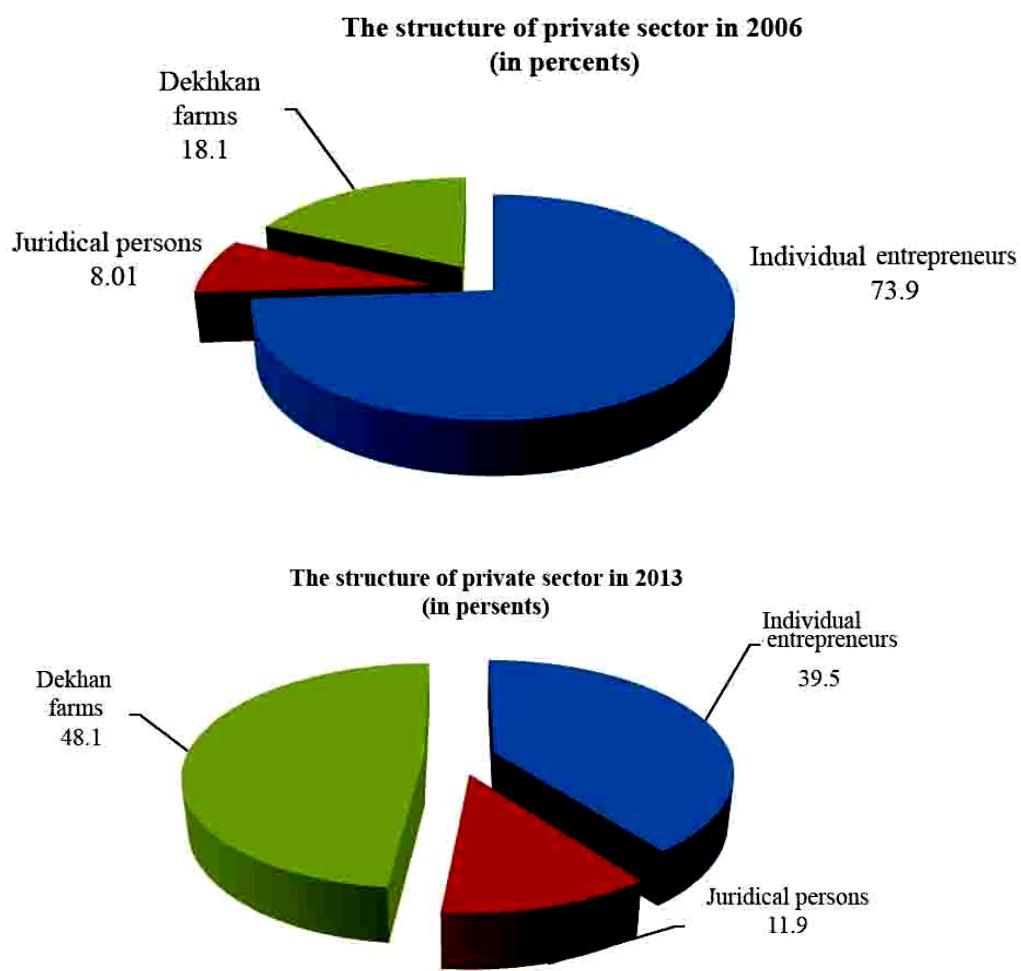

Nevertheless, the decline in the annual growth rate of the number of business organizations indicates the presence of problems and obstacles to creation and development of individual entrepreneurship.

		2005	2006	<i>Annual growth rate (%)</i>	2012	2013	<i>Annual growth rate (%)</i>	<i>Change compared to 2006</i>
	Certificate	34074	37270	9,4	35610	31867	-10,5	-14,5
	Patent	54485	64592	18,5	78339	73643	-5,9	14,01
	Juridical persons	10885	11050	1,5	25728	31263	21,5	82,9
	Dehkan farms	23101	24901	7,8	96764	126825	31,1	409,3
	Total	122545	137813	12,46	236441	263598	11,5	91,3

Source: Tax Committee under the Government of the Republic of Tajikistan

As regards the juridical persons and dehkan farms, in 2013 the annual growth rate of the number of business structures for these types of activities increased and amounted to 21.5% with respect to juridical persons and 31.1% as regards dehkan farms. If we compare the figures of 2006 with 2013 , the growth rate of the number of juridical persons amounted to 82.9% and dekhkan farms to 409.3%.

When analyzing the structure of the private sector and groupping of individual entrepreneurs, dehkan farms, small and medium-sized enterprises, we can see uneven development of business entities.

Source: Tax Committee under the Government of the Republic of Tajikistan

It should be noted that 23 years ago in the Republic of Tajikistan, private sector barely existed. In 2006, 73.9% of business entities were private entrepreneurs, 18.1% were dehkan farms and only 8% were juridical persons.

Today, however, the structure of the private sector has improved significantly, in particular 49.3% are private entrepreneurs, 36.7% are dehkan farms and 13.8% are juridical persons.

Taking the advantages of existing opportunities the private sector makes a significant contribution to the development of national economy and improving people's welfare.

The number of business entities in the country from 146 thousand in 2010 reached 232 thousand in 2014. The growth was almost 60%.

The contribution of the private sector in the formation of gross domestic product is constantly growing, which amounted to almost 64% in 2014.

Last year, the GDP amounted to 40.5 billion somoni, of which 26 billion somoni were from private sector.

The private sector share in the paid registered capital of banks amounted to 97% in 2013, of which 34% related to foreign private capital.

In total savings, the share of private sector is 88%.

In the current year, the amount of indirect taxes in GDP from the private sector was 85% (in the amount of 4.4 billion somoni), of which the value added tax amounted to 3.5 billion somoni, excise - 276 million somoni, sales tax -106 million somoni and customs duties - 475 million somoni.

Over the last 7 years, more than 1600 new industrial enterprises and shops were built, including industrial enterprises for processing minerals and other industrial raw materials, raw cotton, production of building materials, processing fruits and vegetables. This process should be further accelerated.

Only in last year, domestic entrepreneurs built and put into operation 332 new industrial enterprises, created more than 120 thousand of new jobs. Therefore, the share of private sector in providing employment is 63%.

Subsection 5.4. Providing decent jobs and salary level

Employment should provide an income sufficient to achieve a decent standard of living for the population. In developed countries, the level of unemployment well characterizes the labor market, the economy and the success of economic policy.

- **Registered unemployment rate** determines the ratio of unemployed to the number of active population.

Section 6. Housing and basic services

This section covers such issues as improvement of living in informal settlements and prevention of their construction, improving housing affordability, sustainable access to safe drinking water.

Housing remains a critical evaluation category of welfare of the population. The availability of housing – is one of the most pressing and intractable problems in most cities in the world. Recent studies have revealed a certain regularity, which is that as the country's income per capita grows, the housing then becomes more spacious and better, and the proportion of housing units, equipped with water supply, sewers and which are constructed of durable building materials, increases. Over the past two decades, there have been major changes in the approaches by which most governments tried to solve the housing problem through the state support of low-income groups, search for non-budgetary sources of financing, development of rental housing market.

Subsection 6.2. Improving the level of housing affordability

The availability of housing for the population today is the most basic indicator of development of both the construction sector and the economy as a whole. Main activities on ensuring the availability, conducted in the state, are aimed at increasing housing construction volumes, improvement of its quality, creation of housing that conforms to the twenty-first century standards, formation of effective demand for housing, development of legal framework for subsidizing housing construction, providing support for housing sector through urban development projects and programs

Below is the data on housing stock, housing conditions of the population, privatization of residential premises, improvement of settlements.

Housing fund – is the totality of all dwellings irrespective of forms of property, including homes, specialized houses (hostels, orphanages, children's homes, homes for the disabled and veterans, boarding schools at schools, boarding schools, etc.), apartments, company-owned residential apartments, and other dwellings in other buildings for living. Recording is being done according the main property type:

private housing fund - a fund owned by citizens and fund owned by legal persons (established as private owners), including housing construction cooperatives;

State housing stock - residential buildings owned by the state;

public housing stock - houses which belong to collective farms and other cooperative organizations, their associations, trade unions and other civil society organizations:

housing co-operatives stock - houses owned by housing cooperatives;

individual housing stock - houses which are in private property of citizens.

Total area of apartments - includes a living area and an auxiliary area of housekeeping areas. Typically, the housekeeping area includes kitchen, corridors, sanitary units, bathrooms, hallways, niches and cupboards.

Below is not included into the total area of residential apartments:

- stairwells, elevator halls, entrances, common corridors, lobbies, galleries, balconies, loggias, unheated terraces, attics and mezzanines;
- non-residential premises occupied by housing maintenance organizations, shops, post offices, children's institutions, service enterprises, etc.

Subsection 6.3. Ensuring sustainable access to safe drinking water

An example of renewable resources with limited access is fresh water. Many cities in the world face with a serious shortage of fresh water. For the majority of the CIS countries, this problem is not so acute, but the issues of water resources management, conservation and protection of water sources can not be left aside. The main ways of improving the quality and recovery of water resources is the prevention or significant reduction of inflow of wastewater into the natural reservoirs, improving the systems and methods of their cleaning, improvement of land-use management, creation of water protection zones, control over the erosion, etc.

- Coefficient of water demand for household-drinking and other needs of the population.***

Water and Sanitation

As a rule water supply is irregular and of poor quality. Water consumption per capita in Dushanbe is 10 times higher than the European average figure, which is due to inefficient and wasteful use of water and significant water losses due to leakages. Poor physical condition of water distribution networks (level of deterioration is of 50-60%) and inadequate water treatment pose a threat to public health. In 2007, of 699 centralized water supply systems 113 were not functioning, and 358 did not meet sanitary standards.

In addition, according to the estimation, 60% of water distribution networks and related infrastructure are either inactive or do not meet sanitary requirements. This leads to increase in the frequency and severity of outbreaks of epidemic diseases related to water, such as hepatitis A, typhoid, dysentery and cholera, especially in rural areas. To improve the situation of water supply and sanitation in the country a huge investment in this sector is required. According to the Strategy of Development of Water Sector of Tajikistan for 2006-2015, the estimated needs of investment for improving the situation with water supply and sanitation and to achieve the Millennium Development Goals, formulated in the Millennium Declaration, in those areas make 1 billion US dollars.

The situation with drinking water supply and sewerage varies considerably depending on the type of settlements. If in Dushanbe 100% of the population have access to the centralized water supply system, and about 75% - to sewage, then these figures are down to about 55% and 40% respectively in the case of towns with populations of less than 50 000 people.

The Government aims to improve the situation with water supply in urban and rural areas by attracting donor support, as well as grants and loans from international institutions such as the World Bank, Islamic Development Bank, Swiss Agency for Development and Cooperation, Asian Development Bank. For example, the World Bank implemented a project in the field of water supply in Dushanbe (2002) and a second project in the field of water supply (2010) for the purpose of reconstruction of water supply system, which has greatly improved water supply in some parts of the city. In April 2011, in Dushanbe, a new water treatment system was put into operation, which provides almost half of the city's population with clean drinking water. This was made possible due to multi-million grant provided by the World Bank for equipping the new system and rehabilitation of existing water treatment facilities in Dushanbe.

Ismoili Somoni, Firdausi and Sino districts of Dushanbe which are inhabited by 40% of the population of the capital, became the users of new water purification systems. The equipment for a new water purification system was purchased in Germany and installed with the assistance of German experts.

In 2005, the water supply system of Khujand was upgraded, which is the second largest city of the country and the center of the Sughd region. Many elements of water distribution and pumping equipment were replaced, the condition and practice in the field of payment of the fee for water were improved, and water meters were installed almost everywhere in the city. This project, which was implemented with the financial support of the European Bank for Reconstruction and Development (EBRD) and the Swiss State Secretariat for Economic Affairs, serves as a model of good practices for possible replication in other cities.

Projects on improving the situation with water supply in Dushanbe had positive results, and water quality and water availability have slightly improved in recent years. However, taking into account the needs of Dushanbe and the projected expansion of the city after the approval of the master plan, the amount of work which is to be done in this area still remains huge.

The recent building boom in the city and construction of high-rise buildings will create an additional load on the existing inadequate infrastructure and improvements achieved in recent years could be lost in the absence of significant additional investment. The management system of local utilities companies needs to be upgraded, and the practice of payment collection and tariff policy also need to be revised. In Dushanbe there are no water meters in apartment buildings, which leads to wasteful use of water.

The condition of sewer systems operating in cities requires more urgent action, as this sector is characterized by significant underfunding. Most of the country's capacities in cleaning sewage operate at maximum capacity. The growth of urban population creates an additional load on the very outdated sewage infrastructure.

A similar problem exists in collection, storage and incineration of municipal solid waste. The existing system of waste collection is inadequate and is not able to ensure the needs of growing urban population. Few pilot projects implemented in small towns with international support are of fragmented character. In addition, there are no plans to ensure sustainability in the absence of the Government's overall strategy aimed at reforming this sector.

Subsection 6.4. Ensuring sustainable access to basic sanitation and sewerage

Today, in many countries of the world, part of urban population and more than half of rural population are not provided with necessary infrastructure. Sanitation problems are exacerbated by an increase in the size of settlements and population density.

The Government of the Republic of Tajikistan adopted a set of measures on housing construction, improvement of living conditions of the population, accelerating urbanization of rural areas and ensuring their main basic services according to the General Development Plan and programs of social and economic development of regions.

Except for housing stock in cities Dushanbe, Khujand, Rogun, Chkalovsk, Tursunzade and Vahdat, the housing stock which belongs to the service area of public utility companies SUE "HMK" of the Republic of Tajikistan, is characterized by high degree of wear and tear both of the most basic structures of buildings and

utilities, and in some cases it does not meet the requirements of building codes and standards of living.

More than 90% of existing housing stock is operated for more than 30-40 years and requires extensive repairs of both buildings and utilities. Beyond the worn condition of housing utilities, the level of water supply, sanitation, heating, electricity and other services also hampers the provision of basic public utility services to the population.

According to statistical data of the population census of 2010, as of 01.01.2013, out of the total population living of urban and rural areas (7,520,278 people), the below population (in %) had access to basic public services:

- Water supply services:

- 22,0% - connected to public water supply system;
- 6.0% - water supply from individual systems;
- 19.0% - use water from street standpipes;
- 45.0% - use wells, boreholes and other sources;
- 6.0% - no water supply;

- Sewage services:

- 15.0% - use municipal sewage system;
- 6.0% - use private sewage;
- 9.0% - cesspools and other;
- 68.0% - there is no sewage system.

- Collection and disposal of solid waste:

- 8.0% - collected by special vehicles;
- 22.0% - waste collectors are located outside of houses;
- 68.0% - discharge waste into pits on heaps, and other places.

- Heating-system:

- 74% - use individual oven heating;
- 17.0% - use electrical equipment;
- 6.0% - use individual installations, boilers, etc.
- 0.9% - have central heating.
- 6.0% - heated by individual heating systems.

As of 01.01.2014, more than 95% of the housing stock was privatized and handed over to private ownership. However, the housing stock, including utilities, is in increased wear and tear condition because of more than 40-50 years operation and requires major repairs and rehabilitation, which, in turn, requires significant

financial resources. However, the level of profitability of the main part of the population does not allow to allocate funds for rehabilitation and repair of utilities.

In this regard, it is necessary to raise homeowners funds, donor funds and other sources of financing provided by the legislation to implement these works.

The Law of the Republic of Tajikistan "On Architectural Activity, Urban Planning and Construction" establishes the foundations of legal, organizational and social relations in the field of urban planning, defines the rights, duties and responsibilities of government agencies, natural and legal persons of the industry and regulates legal relations arising in connection with urban development activities.

According to the requirements of this law, the complex of social, construction and engineering, architectural and artistic, sanitary and environmental measures must be implemented during the construction.

Main requirements of this document are: compliance with the state, natural and legal persons' interests, providing the population in settlements with favorable living conditions, improving ecological environment, developing transport and social infrastructure utilities in settlements and adjacent areas.

Construction of multi-storey apartment buildings in urban areas.

Due to the population growth in cities and acceleration of urbanization processes, high rate of construction of multi-storey housing is being observed. However, this poses problems with the additional load on existing water supply and sewage, electricity and other utility systems. At that, the developers of new housing should allocate funds for rehabilitation and improvement of utilities capacities in proportion with the cost of new housing construction and in accordance with the standards conditionally specified for new construction. And then, in centralized order, these funds shall be transferred for rehabilitation and improvement of utilities capacities.

In addition, according to current building regulations in the construction of multi-storey housing, the developers should ensure construction of social facilities, such as playgrounds, parks for recreation for the citizens, containment areas and others, but currently these requirements are not met by the developers of a new housing stock. In addition to this, in some regions in the existing housing stock, playgrounds, containment fields, parks and other social facilities are reduced to zero.

Construction of housing estate in rural areas.

In recent years, due to non-compliance with the regulations and town planning rules along with creation of residential areas in allocated new plots of land, the increase of

problems and difficulties with water supply, sewage disposal, electricity supply, removal of solid household waste are being observed in some towns and settlements in rural areas. It should be noted that due to the uncertainty of funding of these services and lack of necessary funds, these settlements have no essential services such as related to health, education, water supply, sewerage, heating, sanitation and other. As a result, some settlements are not provided with access roads, electricity, water supply systems, sanitation, etc.

Increase in spontaneous waste areas, not authorized waste landfill, which are sources of the spread of infectious diseases, contamination of land and water sources pollution, is especially observed in rural areas.

For the purposes of accessibility to public services of appropriate quality and quantity and housing management, the Government of the Republic of Tajikistan adopted the Law "On Maintenance of Multy-Storeyed Buildings and Homeowner Associations" dated 5 August 2009, No 542. The law provides for engaging homeowners in joint management of shared property, organization of utility services in the housing using their own resources. This law regulates the relations connected to the maintenance and use of common property of homeowners in apartment houses. Common property usually includes everything that is outside privatized private apartments, for example, staircases, corridors, basements, attics, roof, mechanical, technical, electrical, plumbing and other equipment inside or outside the house, etc.

Development of alternative forms of management of the housing stock is very slow. In the period from the beginning of 2009 and up to today, after the approval of the Law "On Maintenance of Multy-Storeyed Buildings and Homeowner Associations" only 167 associations of residents of apartment buildings were established in the country.

Another limiting factor of the development of the market of public utility services is that due to more than 40-50 years of operation, the housing stock, including utilities, is in wear and tear condition and needs major repairing and rehabilitation, that results in the need to mobilize considerable financial resources. However, the low level of profitability does not allow to allocate funds for capital repairing of both main parts of buildings and their utilities.

In these circumstances it is necessary to develop a mechanism for the implementation of the Law, in particular by adopting corresponding Decree of the

Government of the Republic of Tajikistan to provide the mechanism for implementation of the Law on Housing Owners' Associations, including:

- Specifying responsible authority for implementation of this Law;
- Regulation of property rights and transfer of rights to non-residential premises;
- Transfer of rights for the land for house and adjacent area and other objects of general use;
- Establishment of a special housing repair fund financed by contributions of homeowners;
- Favorable taxes for Housing Owners' Associations;
- Allocation from the state budget of funds targeted for financing capital repairs of housing and general purpose utilities, etc;
- Give priority status to investment projects on housing rehabilitation;
- Allocation of donor funds for education and training of personnel, which will be able to ensure activities on housing and general supplies management.

Given the current situation in the housing and utilities sector, the "Program on Developing Housing and Utilities Services of the Republic of Tajikistan for the period of 2014-2018" was developed on the basis of the "Concept for Developing Housing and Utilities Services in the Republic of Tajikistan for 2010-2025" and approved by Government of the Republic Tajikistan on August 1, 2014, No 506. The program is developed to provide the basis for further development of housing and utilities services in the country and, as a basic document, defines priorities and general direction of the industry; it is aimed at the population's access to essential basic housing and utilities services.

The program takes into account tasks on the availability of services of water, sanitation and housing, specified in certain important documents of the country, including the Millennium Development Goals, National Development Strategy of the Republic of Tajikistan for the period until 2015, Strategy for Improving the Well-Being of the Population of Tajikistan for 2013-2015 and the Programme on Improving Providing the Population of the Republic of Tajikistan with Clean Drinking Water for 2008-2020 and other regional programs.

The implementation of construction and rehabilitation of water supply, sewerage and the sanitation in general in regions, cities and districts, that is envisaged by the Program of Development of Housing and Utility Services Sector for 2014-2018, needs funding in amount of 3,042,266.0 thousand. somoni.

Funding the scope of works on reconstruction and construction of facilities and systems is to be done through the mobilization of following financial resources,

including the state budget, international financial institutions, own funds of enterprises and other additional sources.

Implementation of this program through efficient operation of production capacity of the industry will provide the country's population with basic vital public utility services, qualitatively and quantitatively relevant to international standards.

Subsection 6.5. Improving access to ecologically friendly local energy resources

In the world there are a number of measures that can reduce the environmental footprint of any city. In general, they are associated with an increase in biomass production, waste decrease or increase of using it as one of input resources in the production, an increase in efficiency of using imported resources, maximal increase in using local energy resources such as wind, solar, construction materials.

Given the importance and urgency of the problem of energy saving the "Concept of Development of Fuel and Energy Complex of the Republic of Tajikistan for 2003-2015" was adopted by the Decree of the Government of Tajikistan on August 3, 2002 No 318.

It is noted in the Concept, that in conditions of crisis and financial and economic problems, the main task of the state is to achieve economic security. An integral and essential part of economic security is energy security, which includes tasks on ensuring stable supply with energy resources and achieving energy independence.

In October 2013, the Law of the Republic of Tajikistan "On Energy Saving and Energy Efficiency" was adopted.

Current trends in the field of energy and resource saving required the development of a regulatory framework for the thermal protection of buildings, recommendations for architectural and engineering practices, as well as the principles of enhancing energy efficiency and designing energy-efficient systems in the climatic conditions of Tajikistan.

Given the urgency of the problem of energy efficiency, increase the heat-shielding rates for newly constructed and operated buildings, significant changes for comprehensive energy conservation in construction were made in regulations on thermal protection of buildings.

To date, building codes MKS RT 23-02-2009 "Thermal Protection of Buildings" were developed and implemented, which set the requirements for thermal protection of buildings in order to save energy, while ensuring sanitary and optimal parameters of indoor climate and durability of building envelopes and structures.

The norms specify three indicator of thermal protection of the building:

- Reduced thermal resistance of individual elements of building envelope;
- Hygienic, including temperature difference between the temperatures of indoor air and the interior surfaces of enclosing constructions;
- Specific consumption of thermal energy for heating the building, allowing to vary the quantities of heat-shielding properties of different types of building enveloping solutions and select climate control systems to achieve rated value of this indicator.

According to the results of scientific research and in addition to building codes, the "Guidance on Designing Thermal Protection of Buildings" was developed.

"Targeted Program on the Use of Alternative Renewable Energy Sources in the Republic of Tajikistan for 2007-2015" was adopted in Tajikistan in 2007.

In 2010, the Law of the Republic of Tajikistan "On the Use of Renewable Energy." was adopted. It mainly focuses on enhancing the engagement of these natural energy resources into economic circulation.

The following renewable energy sources are included into the Law:

- Solar;
- Wind;
- The energy of natural and artificial watercourses and reservoirs;
- Geothermal energy;
- Wood waste, biomass in the form of industrial waste and household waste.

In Tajikistan, there are more than 310 days of sunshine. There are great practically unused geothermal sources of energy, from which we can develop the most reliable cheap energy in the form of heat and electricity.

On March 3, 2011, the Decree of the Government of the Republic of Tajikistan was adopted "About Approval of Rules of Maintaining the State Cadastre of Renewable Energy Sources".

The State cadastre of renewable energy of the Republic of Tajikistan consists of:

- Energy cadastre of natural and artificial watercourses and reservoirs;
- Solar cadastre;
- Wind energy cadastre;

- Geothermal energy cadastre;
- Cadastre of biomass wood waste energy in the form of industrial, agriculture and forestry waste, public utilities and household waste.

Subsection 6.6. Improving access to sustainable transport

In recent decades, the world saw an increase in the number of motorized road vehicles and continued increase of the intensity of air transport, which is one of the main factors increasing the level of consumption of fossil fuels and the emission of gases that causes the greenhouse effect. The reduced dependency on private vehicles can be achieved by the development of public transport system and increasing public transport comfort.
